## Defining California's Water Challenges

Major system deficiencies put public safety, financial stability and economic well being of the State at risk of flooding.

California's Bay-Delta ecosystem is declining with many fish populations at record lows.

Water supplies from the Delta are less reliable. Aging infrastructure and growing population put more pressure on water systems.

Multi-year drought has further stressed water supplies for all purposes. Reservoirs are low and groundwater levels are declining.

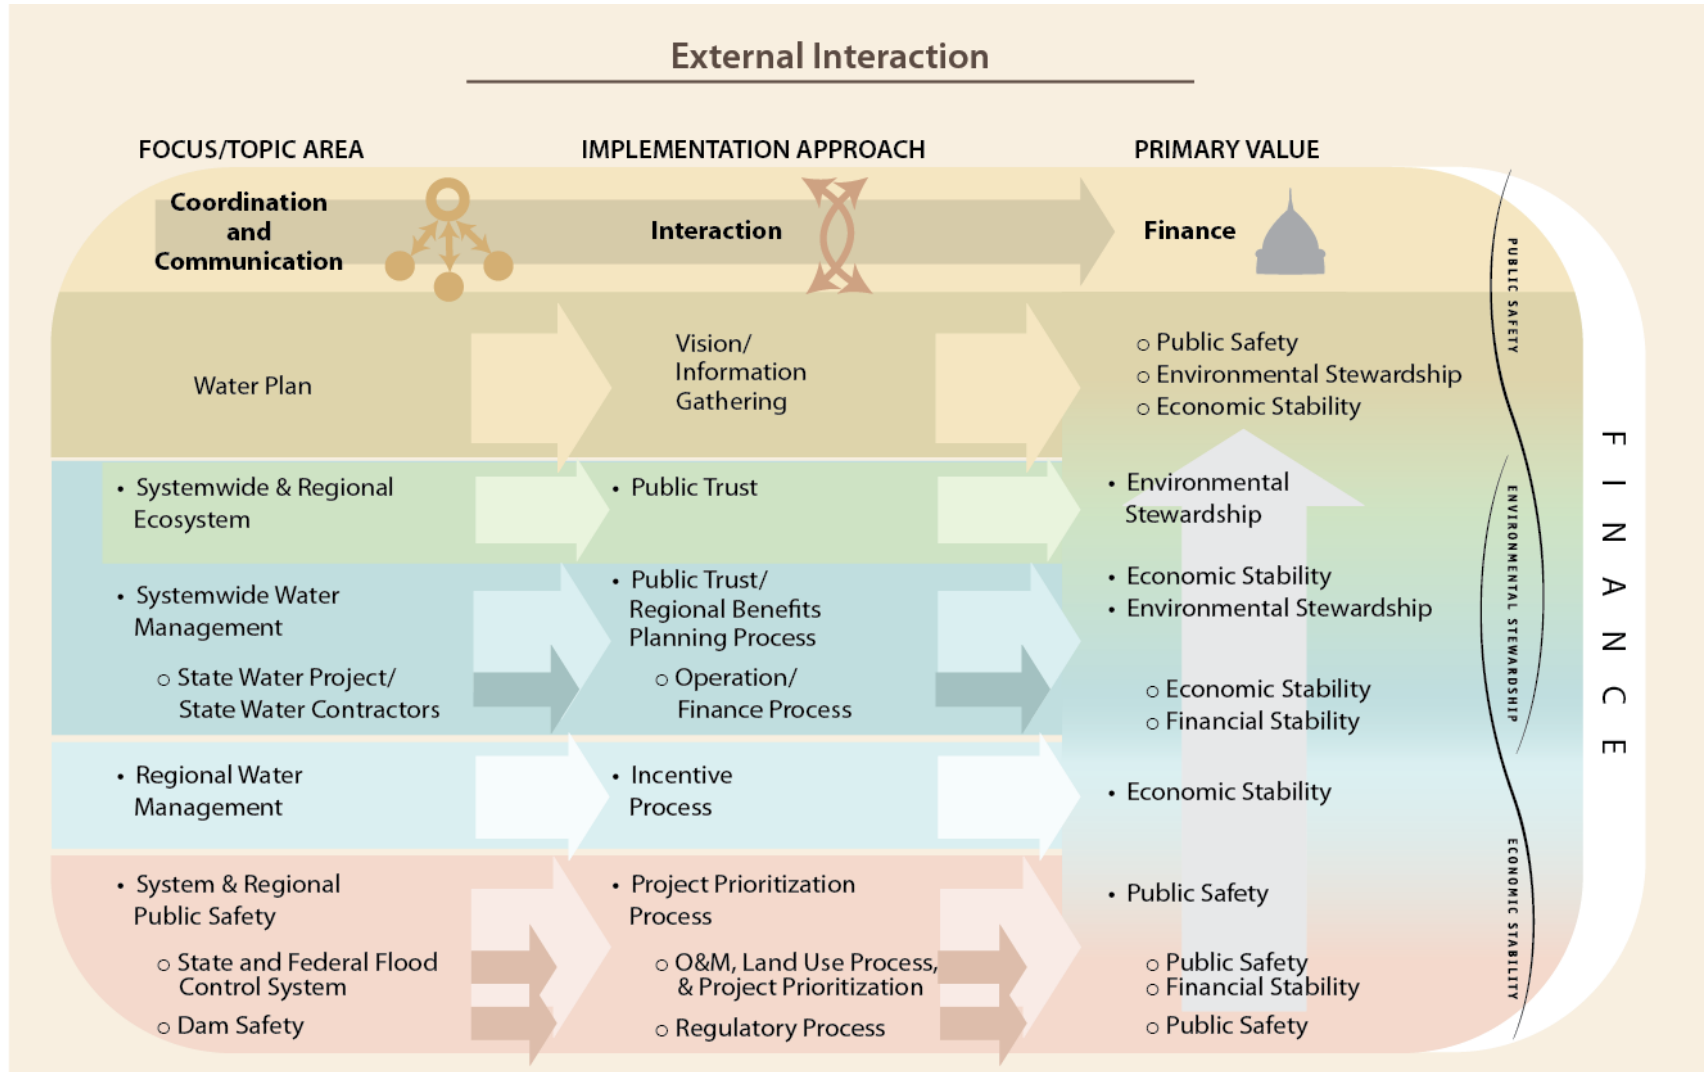

Climate change impacts, including less snowpack, higher flood peaks, and sea level rise, create new uncertainties.

## A Brief History of Flood Protection Actions in California

# Integrating Water Management

## *Recent Investments in California Water*

## IWM's FloodSAFE, is about

### Public Safety

- Making communities safe
- Planning ahead to achieve best collaboration
- Emergency planning and response

### Environmental Stewardship

- Helping ecosystems thrive
- Creating healthier communities by enhancing the environment
- Responsible and reasonable balance between protecting people and the environment

### Economic Stability

- Providing for our families' future
- Protecting businesses and investments
- Enhancing communities

## FloodSAFE California Initiative

In 2006 DWR launched the FloodSAFE California Initiative to improve public safety through integrated flood management.

### Accomplishments

- ✓ Core Flood Management Programs
- ✓ Regional Projects
- ✓ System-Wide Investments

# Integrating Water Management

$$\text{Risk} = \text{Hazard} + \text{Exposure} + \text{Performance} + \text{Consequences}$$

**Hazard**

**Exposure**

**Performance**

**Consequences**

## Flood Hazard Types in California

### Flood Hazard Types in California

The duration and spatial extent of flooding in different hazard types is a function of both the local geography and hydrology.

-  **Alluvial Fans**  
Flooding can occur when fast-moving mountain streams spread as they reach flatter plains.
-  **Banked Rivers / Headwater Regions**  
Mountainous and hilly terrain has natural defined banks that quickly pass flood waters.
-  **Coastal / Tidal Estuary**  
Subject to daily tidal action and often comprising a complex network of braided channels, these areas form flood-prone islands.
-  **Deep Floodplain**  
These flatlands are prone to seasonal flooding. Many of these areas are protected by levees.

# Integrating Water Management

## Hazard Characteristics

Characteristic	Alluvial Fans	Banked Rivers / Headwaters	Coastal / Tidal Estuaries	Deep Floodplains
Time to Peak	Hours	Hours	Days	Days
Duration of Flood	Hours	Weeks	Seasonal	Weeks
Area Flooded	Small	Small	Medium	Large
Drainage Area	Small	Medium	Variable	Large
Characteristic Storm	Thunderstorm	Winter	Winter & Spring Tide	Winter & Snow Melt
High Sediment Load	Yes	No	No	No
Man-Made Levees	Rare	Rare	Variable	Common

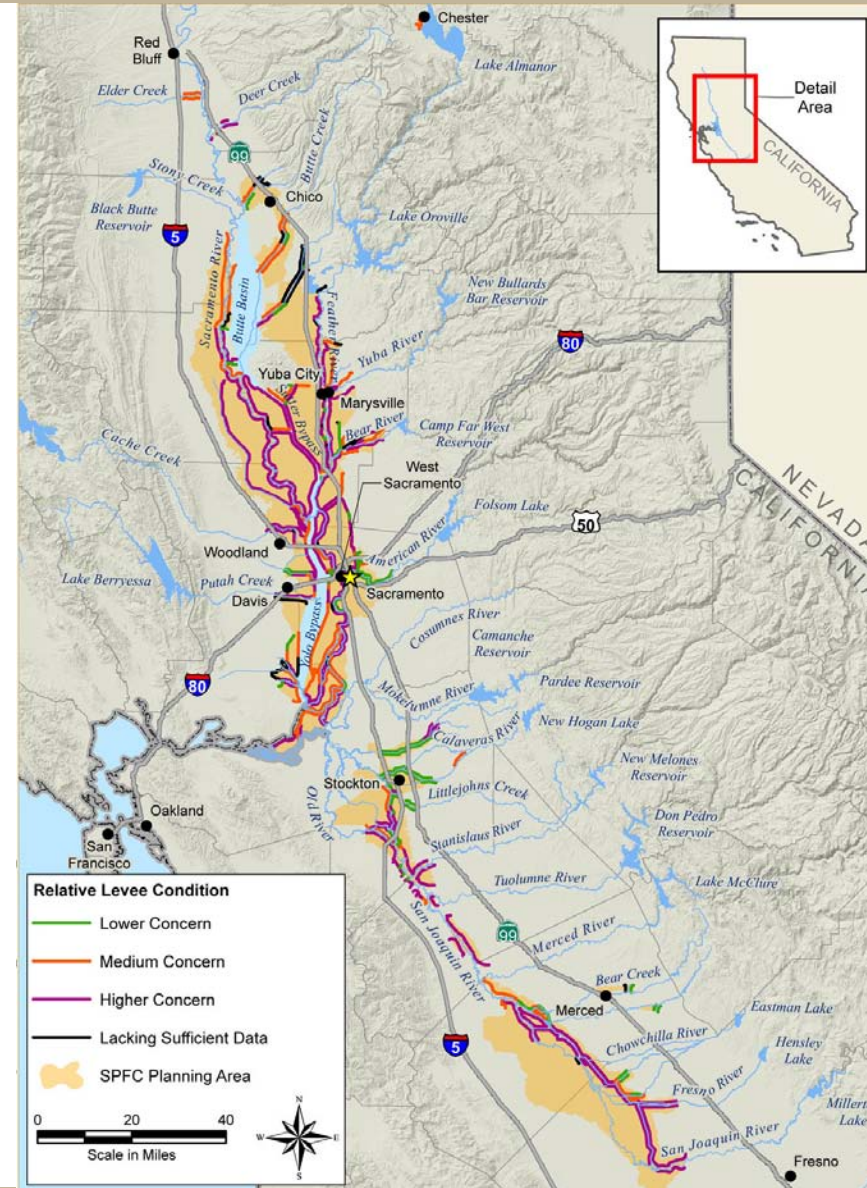

# Exposure

# Integrating Water Management

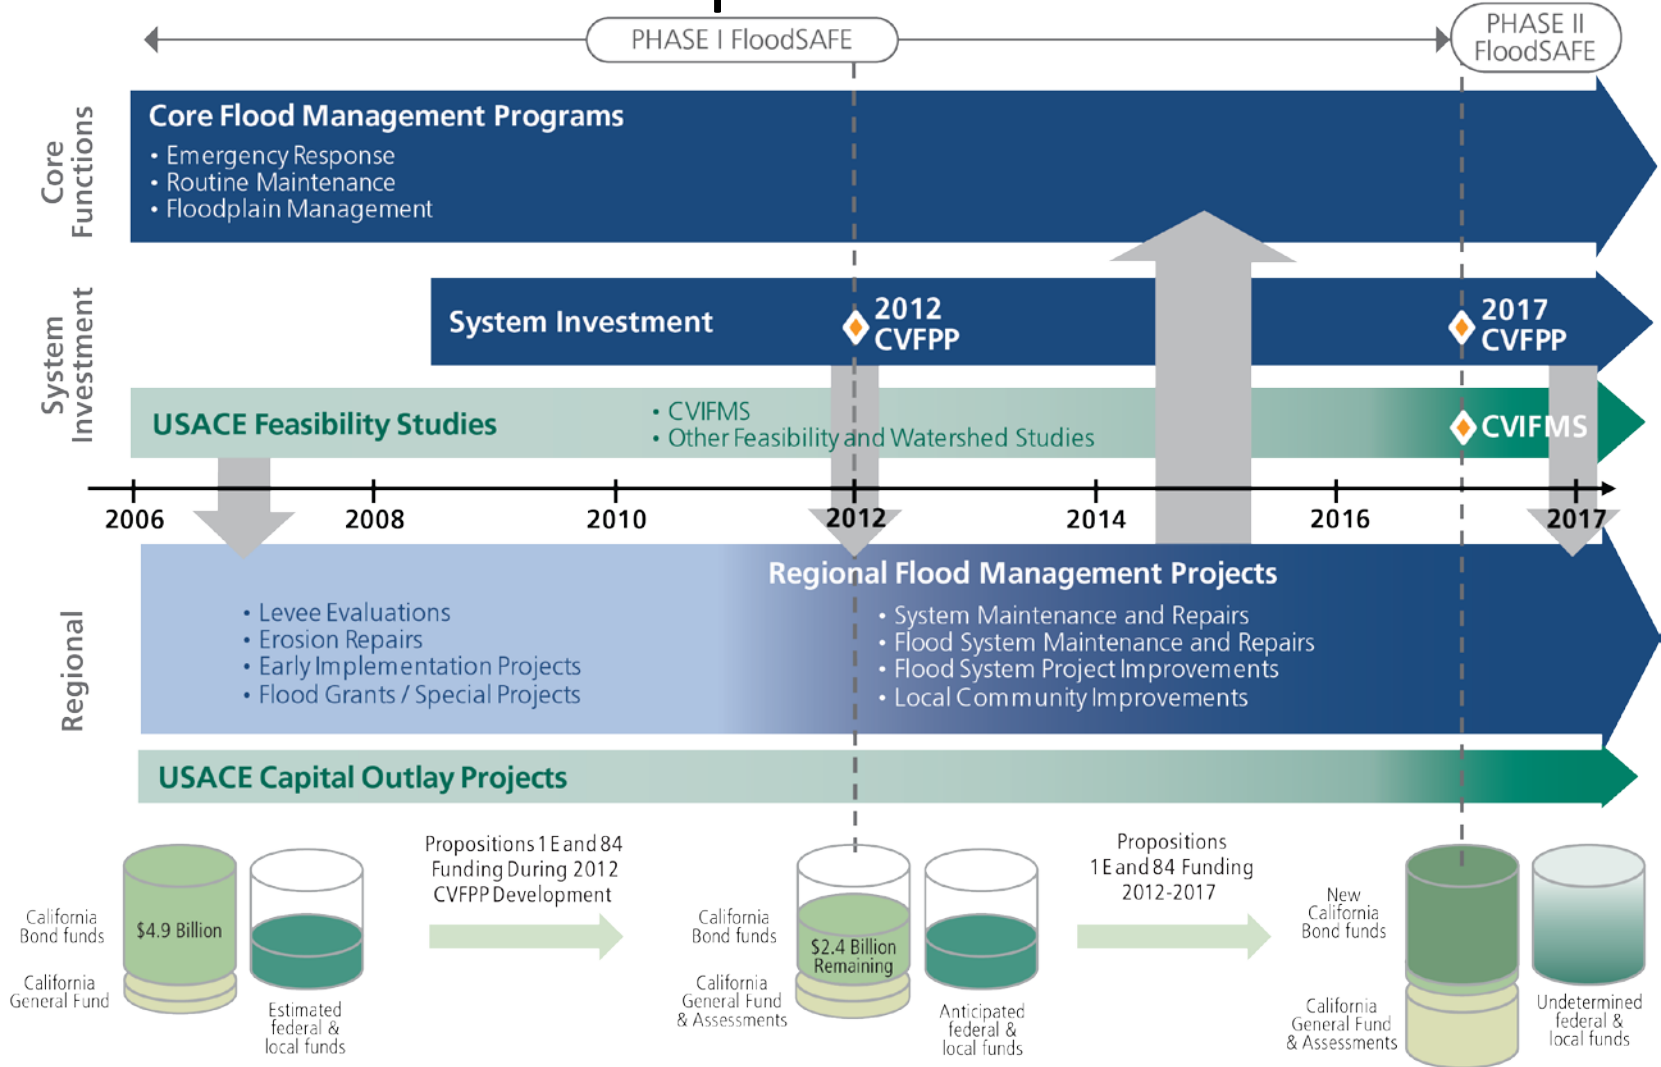

## Performance

- ~50% of 300 miles of SPFC urban levees do not meet design criteria
- ~60% of 1,200 miles of SPFC non-urban levees have high potential for failure
